

Section 7.1 – Angles and Their Measure

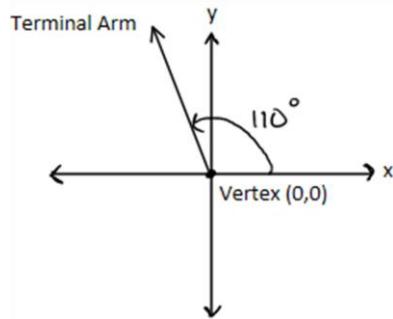

- Trigonometry is all about the study of angles
- An Angle is determined by rotating an arm in a counter-clockwise position at its endpoint
- The endpoint is called the vertex of the angle
- The arm rotating around is called the terminal arm
 - It can rotate in a clockwise direction (negative angle)
 - Or counter clockwise direction (positive angle)

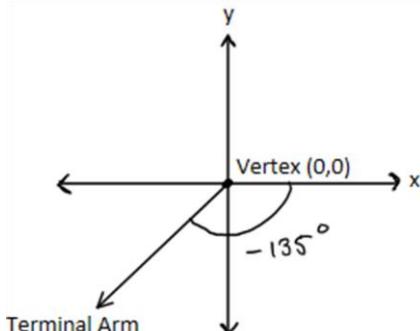

Angles in Standard Position

An angle θ is said to be in **Standard Position** if its **vertex** is at the origin and it originates from the **positive x – axis**. Rotating the terminal arm counter clockwise about the vertex **forms a positive angle θ** , where rotating clockwise about the vertex **forms a negative angle θ** .

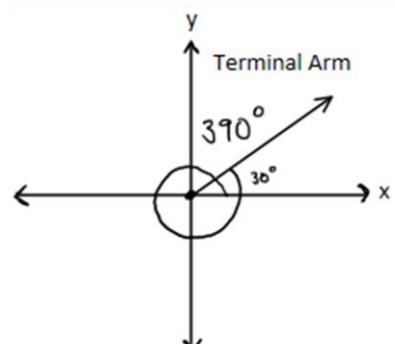

Examples:

- Counter Clockwise
- Positive Direction
- Past the 90° Mark
- An extra 20° into Q2
- Making 110°

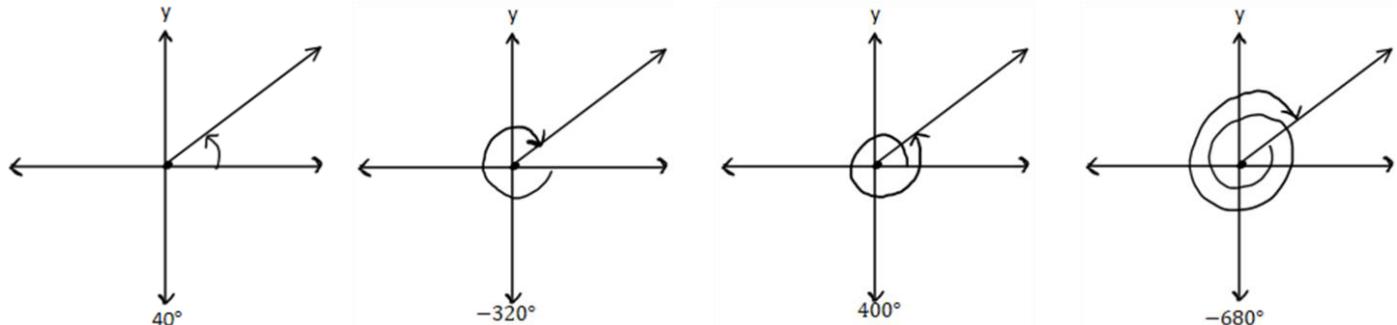

- Clockwise
- Negative Direction
- Past the -90° Mark
- An extra -45° into Q3
- Making -135°

- Counter Clockwise
- Positive Direction
- Past the 360° Mark
- An extra 30° into Q1
- Making 390°

Co-Terminal Angles

- Angles in Standard Position that have the same terminal side are called Co-Terminal angles
- Think about adding or subtracting an entire rotation 360° , from the given angle
- There are an infinite number of Co-Terminal angles, we can add or subtract multiples of 360°

Rotation of 40°

Rotation of $40^\circ - 360^\circ$

Rotation of $40^\circ + 360^\circ$

Rotation of $40^\circ - 2(360^\circ)$

Example 1: If $\theta = 120^\circ$, in Standard Position, find two positive and two negative angles that are co-terminal with θ

Solution 1: There are an infinite number of solutions, so add or subtract 360° to your hearts content

$$120^\circ + 360^\circ = 480^\circ$$

$$120^\circ + 2(360^\circ) = 840^\circ$$

$$120^\circ + 8(360^\circ) = 3000^\circ$$

$$120^\circ - 360^\circ = -240^\circ$$

$$120^\circ - 2(360^\circ) = -600^\circ$$

$$120^\circ - 8(360^\circ) = -2760^\circ$$

Example 2: Find the smallest positive co-terminal angle for

- 2692°
- -1940°

Solution 2:

- Divide 2692 by 360 to see how many full rotations have occurred

$$\frac{2692}{360} = 7.47777\ldots \quad 7 \text{ full rotations:} \quad 7 \cdot 360 = 2520^\circ$$

$$2692^\circ - 2520^\circ = 172^\circ$$

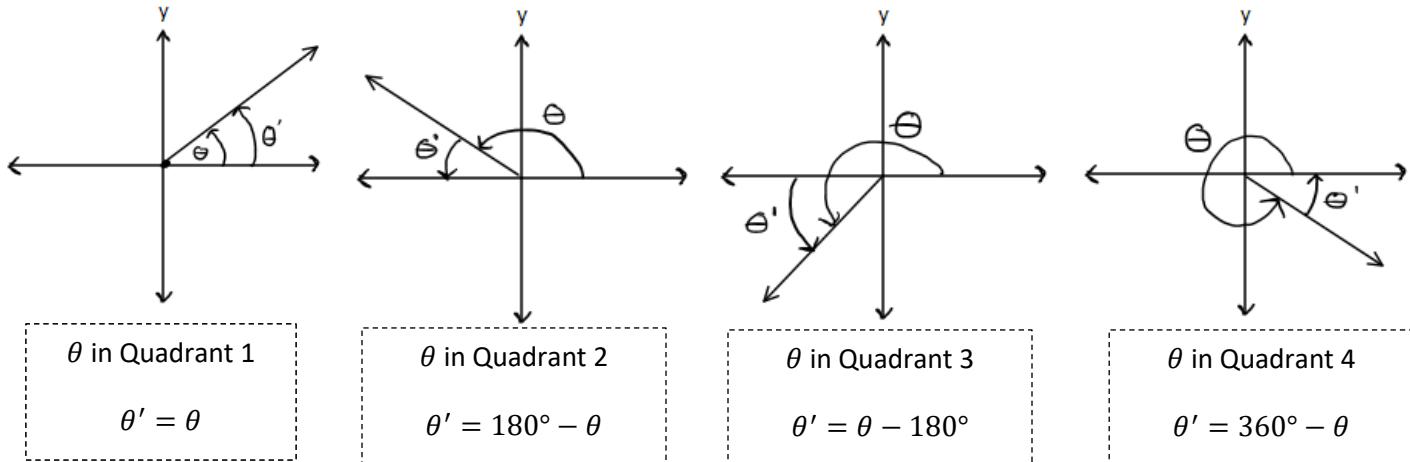

- Divide 1940 by 360 to see how many full rotation in the negative direction

$$\frac{-1940}{360} = -5.3888\ldots \quad \begin{aligned} &\text{Since we went negative we will need 6 rotations to} \\ &\text{get back to the positive.} \quad 6 \cdot 360 = 2160^\circ \end{aligned}$$

$$-1940^\circ + 2160^\circ = 220^\circ$$

Reference Angles

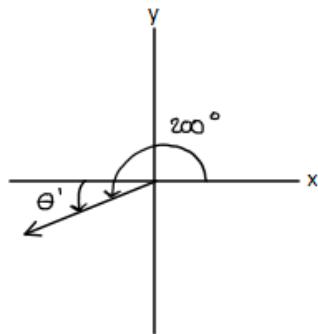

- For an angle θ in Standard Position, the reference angle is the positive acute angle θ' that is formed with the terminal side of θ and the $x-axis$.
- Read that again...
- A reference angle is between 0° and 90° : $0^\circ \leq \theta' \leq 90^\circ$
- This will start to make a lot more sense in applications in Section 7.2

Example 3: Find the reference angle for: a) 200° b) 300° c) -200°

Solution 3:

a)

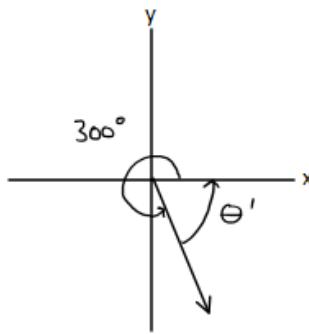

$$\theta' = \theta - 180^\circ$$

$$\theta' = 200^\circ - 180^\circ$$

$$\theta' = 20^\circ$$

b)

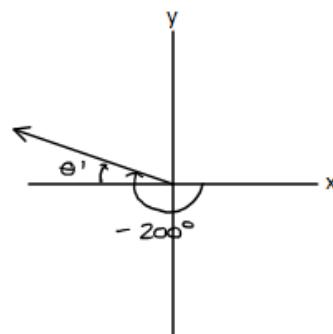

$$\theta' = 360^\circ - \theta$$

$$\theta' = 360^\circ - 300^\circ$$

$$\theta' = 60^\circ$$

c)

The Co-Terminal Angle of -200° is 160°

$$\theta' = 180^\circ - \theta$$

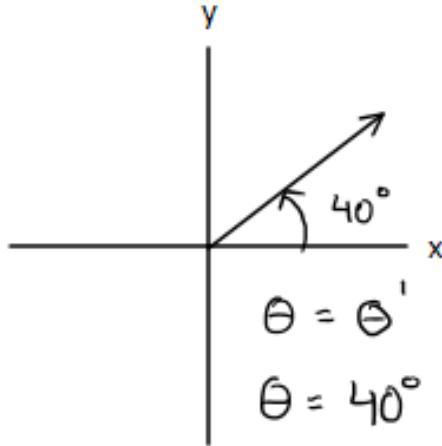

$$\theta' = 180^\circ - 160^\circ$$

$$\theta' = 20^\circ$$

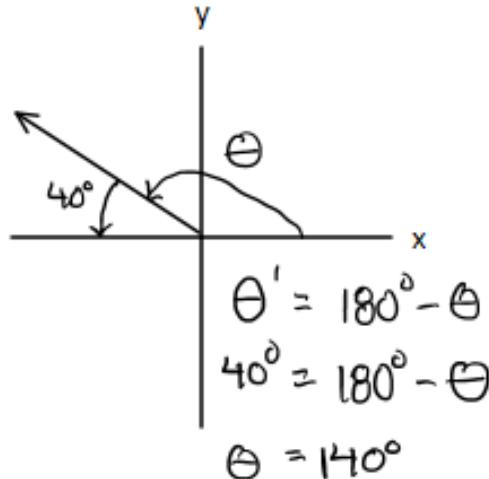

Example 4: Determine the smallest positive angle in Q 1, 2, 3, 4 that has a reference angle of 40°

Solution 4:

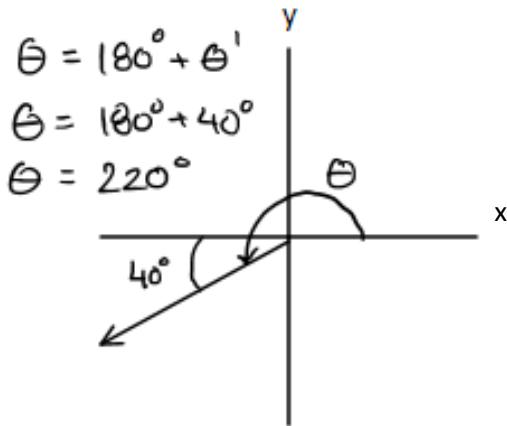

Quadrant 1

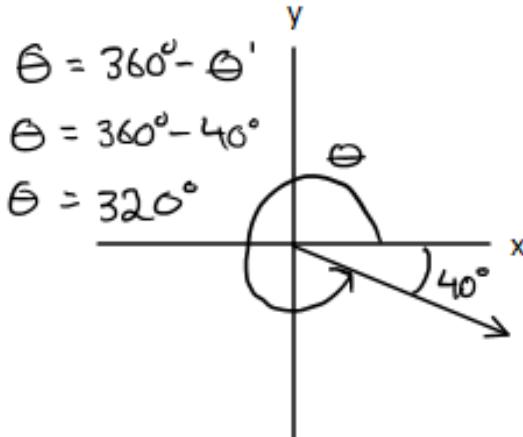

Quadrant 2

Quadrant 3

Quadrant 4

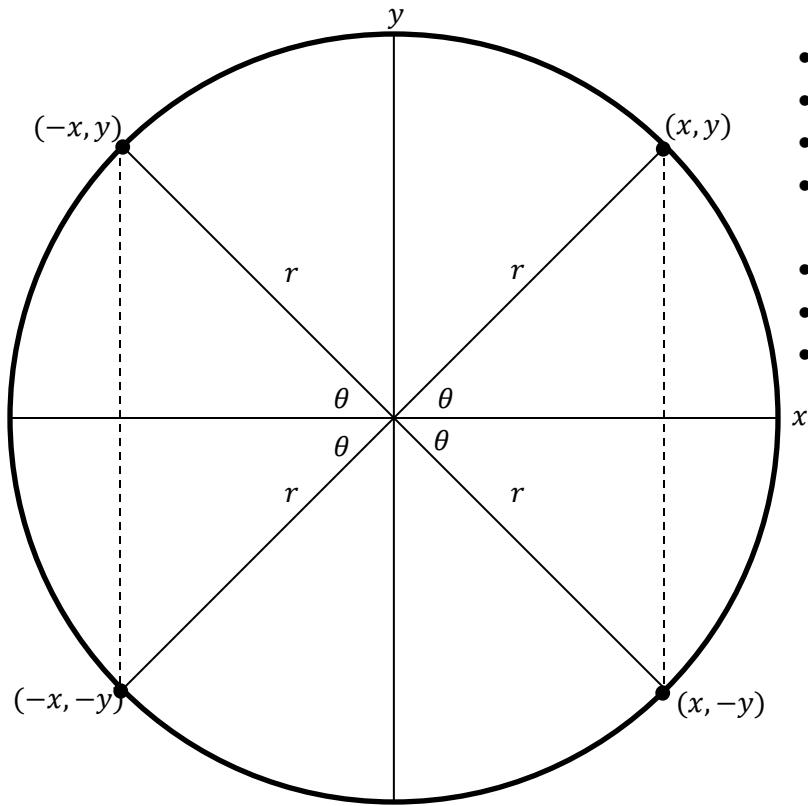

Example 5: Determine the Reference Angle for:

- a) 612° b) -420° c) 844° d) 6425°

Solution 5:

- | | | |
|---|--|-----------------------|
| a) $612^\circ \rightarrow 612^\circ - 360^\circ = 252^\circ$; 252° is in Q3 | so: $\theta' = 252^\circ - 180^\circ = 72^\circ$ | Ref Angle: 72° |
| b) $-420^\circ \rightarrow 2(360^\circ) - 420^\circ = 300^\circ$; 300° is in Q4 | so: $\theta' = 360^\circ - 300^\circ = 60^\circ$ | Ref Angle: 60° |
| c) $844^\circ \rightarrow 844^\circ - 2(360^\circ) = 124^\circ$; 124° is in Q2 | so: $\theta' = 180^\circ - 124^\circ = 56^\circ$ | Ref Angle: 56° |
| d) $6425^\circ \rightarrow 6425^\circ - 18(360^\circ) = 55^\circ$; 55° is in Q1 | so: $\theta' = 55^\circ$ | Ref Angle: 55° |

The Coordinate System

- Note: *radius* $r > 0$
- By Pythagorean Theorem: $x^2 + y^2 = r^2$
- So all the triangles must be equal
- So reference angles to the Standard Position must be equal
- $(-x, y)$ is (x, y) reflected over the $y-axis$
- $(-x, -y)$ is (x, y) reflected over both *axes*
- $(x, -y)$ is (x, y) reflected over the $x-axis$

Example 6: Find all angles, $0^\circ \leq \theta \leq 360^\circ$, that have a reference angle of 20°

Solution 6:

$$\begin{aligned} Q1: & \text{it is also } 20^\circ \\ Q2: & 180^\circ - 20^\circ = 160^\circ \\ Q3: & 180^\circ + 20^\circ = 200^\circ \\ Q4: & 360^\circ - 20^\circ = 340^\circ \end{aligned}$$

Example 7: If Quadrant 2 and 4 have the same reference angle, and the Standard Position Angle in Quadrant 2 is 165° , what is the Standard Position Angle in Quadrant 4?

Solution 7:

If Q2 has an angle in Standard Position of 165° , then its Reference Angle is:

$$180^\circ - 165^\circ = 15^\circ$$

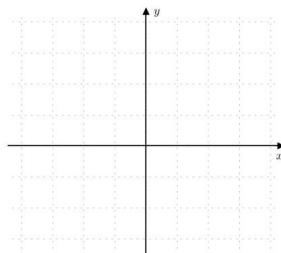

So then the Standard Position Angle in Q4 is:

$$360^\circ - 15^\circ = 345^\circ$$

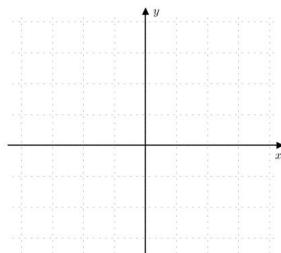

Section 7.1 – Practice Problems

Sketch the angles in Standard Position

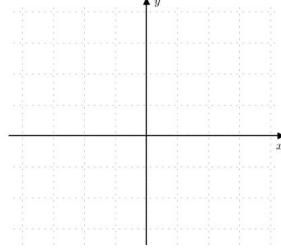

1. 110°

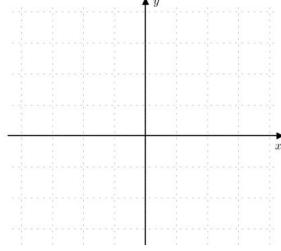

2. -110°

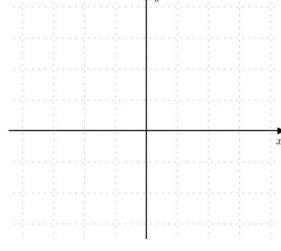

3. 220°

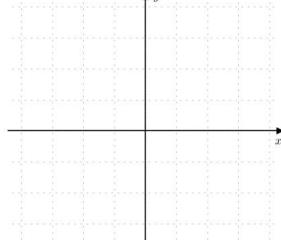

4. -220°

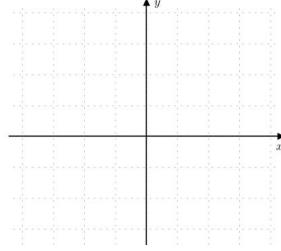

5. 290°

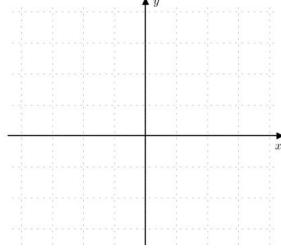

6. -290°

7. 400°

8. -400°

Find the angle of the smallest positive measure co-terminal to the given angle.

9. -30°

10. -96°

11. -197°

12. -314°

13. -127°

14. 405°

15. 502°

16. 437°

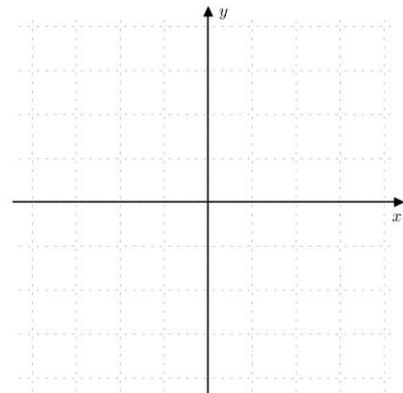

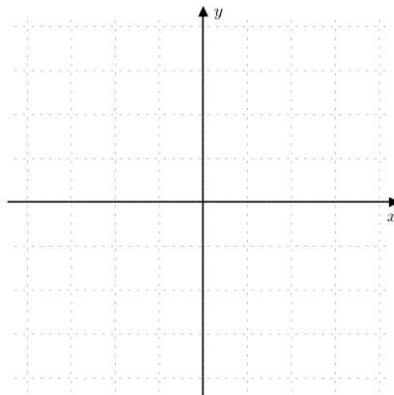

17. 615°

18. -475°

Draw an angle θ in Standard Position, where θ is the smallest measure, and the given point is on the end of the terminal arm. Then determine the length of the terminal arm.

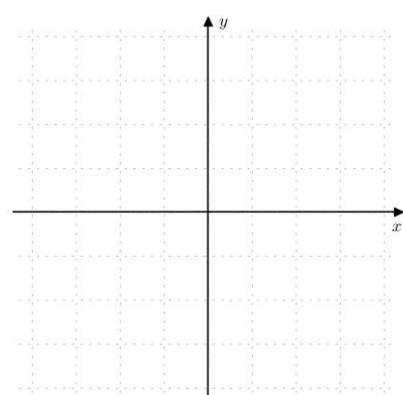

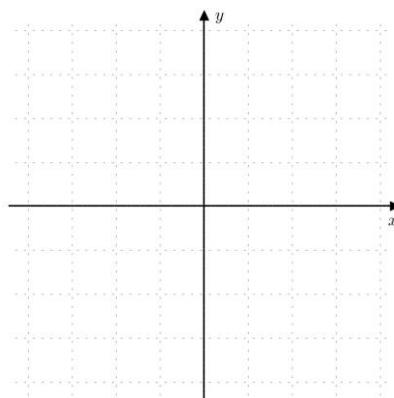

19. $(-4, 3)$

20. $(3, 4)$

21. $(5, -12)$

22. $(-12, -5)$

Pre-Calculus 11

Find the reference angle

23. 32°

24. -32°

25. 113°

26. -113°

27. 218°

28. -218°

29. 304°

30. -304°

31. 832°

32. -1213°

Find all the angles, $0^\circ \leq \theta \leq 360^\circ$, that have reference angles of the following.

33. 37°

34. 71°

35. 0°

36. 90°
